Summary

Full-Stack Software Engineer with 1+ years of experience across startups, building backend services, payment systems, and asynchronous processing infrastructure. Proficient in TypeScript, Node.js, PostgreSQL, Redis, and BullMQ, with experience in REST APIs, payment verification, credit ledgers, and RBAC. Experienced in owning features end to end and shipping production-ready solutions in fast-paced startup environments.

Education

Indian Institute of Information Technology, Jabalpur — **Madhya Pradesh, India**
Bachelor of Technology — *2022 – 2026*

Technical Skills

Languages: JavaScript (ES6+), TypeScript, Python Java

Backend: Node.js, Express.js, FastAPI, REST APIs, Socket.IO, Role-Based Access Control (RBAC), JSON Web Tokens (JWT), BullMQ, SOLID Princples, Microservices, Distributed System

Databases: PostgreSQL, SQL, MongoDB, Redis, Schema Design, Database Migrations, Prisma ORM

Frontend: React.js, Next.js, Zustand, TanStack Query, HTML5, CSS3, Tailwind CSS, Responsive Design, Cross-Browser Compatibility, Web Performance Optimization

Cloud and Tools: Amazon Web Services (AWS: EC2, ECS, S3), Docker, Linux, Git, GitHub, Continuous Integration and Continuous Deployment (CI/CD), Postman

AI: AI Agents, Generative AI, Retrieval-Augmented Generation (RAG), LangChain, OpenAI API, Vector Database, Embeddings

Experience

Software Engineering Intern — **Dec 2025 – Present**
Skyclad Ventures — *Remote*

- Worked with the product manager to ship full-stack features across the frontend, backend APIs, and background workers (Next.js, React, TypeScript, Node.js, PostgreSQL) for a court E-Filing platform and Payment center.
- **E-Filing:** Owned the entire frontend from scratch (Next.js, Zustand), including payer-facing interfaces.
- **E-Filing:** Built the filing verification and management Frontend contract for the court E-Filing platform, working with another developer on the backend.
- **E-Filing:** Developed filing verification and case management workflows, streamlining document review, filing status tracking, and administrative operations across the platform.
- **Payment Center:** Developed 30+ reusable React and TypeScript components, reducing repeated frontend effort and cutting integration issues by about 40% through standardized API contracts, validation rules, and error handling.

Software Engineering Intern — **Jun 2025 – Aug 2025**
Bloop — *Remote*

- Collaborated with the backend team and owned the credit-based rewards system, built with Python and FastAPI, implementing backend logic for credit allocation and redemption.
- Developed and validated RESTful APIs with FastAPI, implementing input validation, exception handling, and reliable request processing; tested endpoints with Postman and REST Client.
- Redesigned credit accrual and redemption workflows to improve transaction transparency, strengthen fraud prevention, and support user engagement and retention.
- Improved frontend page load performance by 15% by optimizing API integration and reducing unnecessary data processing, while improving code maintainability.

Frontend Engineer Intern — **Jan 2025 – Feb 2025**
Meteorite Labs — *Remote*

- Built and shipped 3 landing pages in Next.js from design specifications, from scratch, which helped launch the MVP within 1.5 months.
- Developed reusable dashboard components and worked with senior engineers to resolve cross-browser issues and improve frontend performance.

Projects

Kairo – Visual Workflow Automation Platform — **2026**
Next.js, React Flow, Zustand, Express.js, Redis, BullMQ, PostgreSQL, Razorpay
Code: github.com/exorcist09/kairo-v2 | Live: kairoworkflow-landing.vercel.app

- Built the product end to end: PostgreSQL schema design and migrations, authentication and authorization, REST APIs, and a React Flow editor with Zustand state management and real-time execution updates through Socket.IO.
- Engineered asynchronous workers with Redis and BullMQ (retries, error handling), separating API requests from long-running workloads, with database transactions and execution-state persistence for reliable concurrent runs.
- Implemented credit-based billing with Razorpay (server-side payment verification, credit ledgers, protected API endpoints) and built KAI, an AI agent that orchestrates workflow nodes and tools.
